TWO WAYS AN ORDER STARTS

ORDER, RECEIVE AND ISSUE

ACCOUNTING

GR/IR clearing keeps a receipt and its invoice from being counted twice.

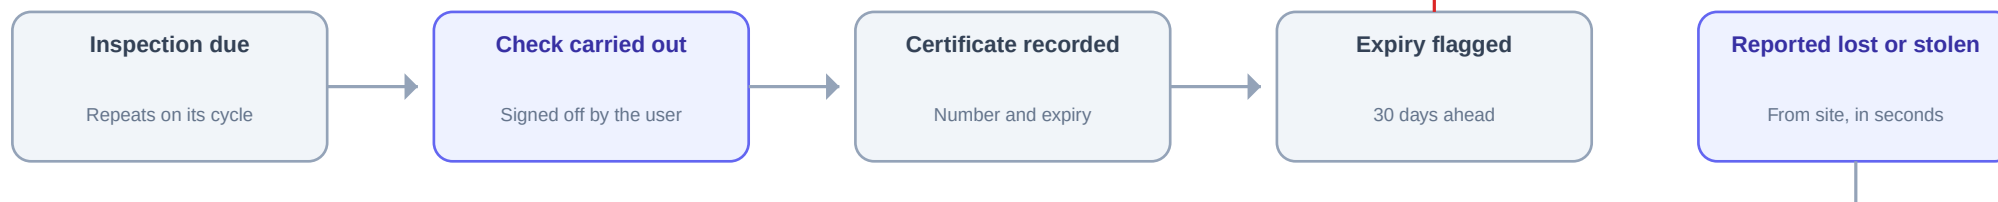

On Starter, a purchase order goes straight from draft to the vendor - no approval step.

 ☐ Approver (manager)
 ☐ Stocked (automatic)
 ☐ Finance

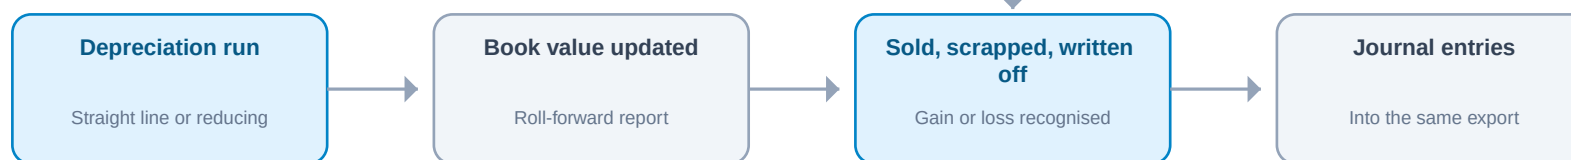

CUSTODY

SAFETY AND LOSSES

VALUE ON YOUR BOOKS

A lost tool leaves service immediately and the loss register carries the value until it is found or written off.

Separation of duties

The person who raises a purchase order cannot approve the receipt of those goods. Six roles, enforced on the server.

Delegation of authority

Each member has a manager and an approval limit. Spend climbs the line until someone has the authority. Nobody approves their own.

Approval trail

Every endorsement, approval and rejection is kept on the document with names, job titles, times and notes.

Stock counts

Physical counts logged with who was present, variances approved before they post to the ledger.

Cost attribution

Issues can be required to carry a cost center or job code, so spend cannot land in a general bucket.

Audit log

Who changed what, and when, across the account - searchable and exportable on every plan.

Certificates

Inspection and calibration dates sit with the tool; uncertified kit can be blocked from leaving the store.

Blind receipts

Goods received without a purchase order are held as a draft until someone confirms the value.

Three-way match

Purchase order, goods received and vendor invoice are compared; the difference posts as price variance.
